

The Healthcare Technology Challenge: Software to Manage Tomorrow's Healthcare Operations

Current Technology Demands and Service Oriented Architecture Market (SOA)

Connecting new applications and business processes with existing legacy applications and business processes is a long-standing goal for healthcare organizations. In response, the IT industry offers Service Oriented Architecture (SOA). SOA transforms a business into a set of linked services, processes, and repeatable business tasks, which can be accessed when needed across an organization.

Portal Technology

Portal technology is web-based software that provides one entry point for new and legacy systems, business processes, data, information, and people. It creates a unified user experience through a single interface for an entire business. Portals offer the potential for real business results and cost savings across an organization through easy access and manipulation of information, and improved communication.

The Healthcare Provider Operational Challenge

- Improve efficiency and performance
- Reduce expenses
- Increase revenue
- Manage cash flow
- Track and report Quality Indicators
- Enhance staff development
- Provide better customer information access

Why SOA and Portal Technology?

The implementation of portal technology is typically the first step towards capitalizing on an SOA environment. The portal brings the right information to the right user to accomplish tasks faster and more accurately. Because healthcare organizations have both heterogeneous and legacy systems, they need the means to integrate these disparate systems. Business integration is the key to unlocking the value of their existing IT investment, no matter the underlying technology. The combination of a portal and an SOA approach enables an enterprise to achieve this vital goal.

The Virtuosant Answer

Virtuosant combines technologies into an easy-to-manage, cost effective solution that gives providers tools for managing their organizations well.

- SOA and Portal technology
- Software Pack from IBM
 - IBM DB2 database software for database technology
 - WebSphere Portal Server software for running portal software
 - Lotus Foundations for security/recovery, information management, and Scorecards
 - Lotus Web Content Management for content management
 - WebSphere sMash for content/data retrieval and reporting
- Amazon Web Services Cloud technology for on-demand computing use
- Pervasive Software for superior data integration
